Using Meladerm to Reduce Dark Spots

There is much to be discovered about the skin care products we use. For one, it is important that we know their ingredients because not all manufacturers take care to put only safe and proven effective materials in their products. Many skin lightening products for example have hydroquinone, which at the beginning was thought to be a safe bleaching agent but turned out to be harmful instead. A better alternative is a product that uses ingredients derived from naturally occurring substances. [Meladerm](#) is a skin lightening product made of Kojic acid, and other potent plant extracts known for their skin lightening properties. Meladerm can be used to reduce dark spots, sun damage, old scars, freckles, birthmarks and acne scars.

It can also be used to treat uneven skin tone in the armpits, elbows and knuckles. While other manufacturers may boast of having the same ingredients plus some obscure supposed to be miracle ingredient, they may not be handling them in a manner that preserves their potency up to the minute that the product is used.

The manufacturers of Meladerm guarantees that the ingredients in this product has passed strict quality control that assures the consumer that each ingredient's skin lightening power is intact and effective from the moment it is gathered from sources, shipped to the manufacturing facility, and packaged, delivered, and reach you, the consumer.

Meladerm cream works by controlling the natural production of melanin, the pigment that gives our skin its color. The more melanin is found in our skin, the darker it becomes. Meladerm naturally and gently fades skin with dark spots to give you an even toned complexion. Most users say that they obtained their desired results within or after two weeks of regular daily application.

Most of them got the full benefit of [Meladerm](#) after two to three months of continued use. Sunscreen must be used at the same time because as with other skin lightening products, the skin becomes more sensitive to the sun's rays. It must be noted too that results may vary due to the individual's skin condition and physiology.
